

Note: In this problem set, expressions in green cells match corresponding expressions in the text answers.

1 - 10 Flux integrals (3) $\int_S \mathbf{F} \cdot \mathbf{n} \, dA$

Evaluate the integral for the given data. Describe the kind of surface.

1. $\mathbf{F} = \{-x^2, y^2, 0\}$, $S : \mathbf{r} = \{u, v, 3u - 2v\}$, $0 \leq u \leq 1.5$, $-2 \leq v \leq 2$

```
Clear["Global`*"]
```

```
ParametricPlot3D[{u, v, 3 u - 2 v}, {u, 0, 1.5}, {v, -2, 2}]
```

This is a plane. The parametric expression for \mathbf{r} is already available.

```
gtoe[u_, v_] = {u, v, 3 u - 2 v}
```

```
{u, v, 3 u - 2 v}
```

Taking the partial derivatives to get ready for calculating the normal vector.

```
fir = D[{u, v, 3 u - 2 v}, {u}]
```

```
{1, 0, 3}
```

```
sec = D[{u, v, 3 u - 2 v}, {v}]
```

```
{0, 1, -2}
```

Then finding the normal vector.

```
norm = Cross[fir, sec]
```

```
{-3, 2, 1}
```

At this point the s.m. explains that it is time to substitute the elements of \mathbf{r} into \mathbf{F}

$$\mathbf{F2} = \{-u^2, v^2, 0\}$$

Then take the dot product $\mathbf{F2} \cdot \mathbf{norm}$. (Unfortunately *Mathematica* won't accept symbolic arguments here.)

$$\mathbf{dotFN} = \{-u^2, v^2, 0\} \cdot \{-3, 2, 1\}$$

$$3u^2 + 2v^2$$

$\iint_S (\mathbf{dotFN}) \, dA$ will be essentially what I will be looking for next.

$$\int_{-2}^2 \int_0^{1.5} (3u^2 + 2v^2) \, du \, dv$$

29.5

The value shown on the above line is the text's answer to the problem.

$$3. \mathbf{F} = \{0, x, 0\}, \quad S : x^2 + y^2 + z^2 = 1, \quad x \geq 0, \quad y \geq 0, \quad z \geq 0$$

```
Clear["Global`*"]
```

It will be necessary to parameterize S . This will be simpler looking than the sphere in Sec 10.5, because the center is at the origin, and the root of the radius expression is 1.

```
sph[u_, v_] = {Cos[v] Cos[u], Cos[v] Sin[u], Sin[v]}
{Cos[u] Cos[v], Cos[v] Sin[u], Sin[v]}
```

I had a consistent sphere parameterization, but changed it so that it would match the text's version, swapping u and v , essentially.

```
ParametricPlot3D[
  {Cos[v] Cos[u], Cos[v] Sin[u], Sin[v]}, {u, 0,  $\pi$ }, {v, 0,  $2\pi$ }
```

Taking the partial derivatives to get ready for calculating the normal vector.

```
fir = D[{Cos[v] Cos[u], Cos[v] Sin[u], Sin[v]}, {u}]
{-Cos[v] Sin[u], Cos[u] Cos[v], 0}
```

```
sec = D[{Cos[v] Cos[u], Cos[v] Sin[u], Sin[v]}, {v}]
{-Cos[u] Sin[v], -Sin[u] Sin[v], Cos[v]}
```

Then finding the normal vector.

```
norm = Simplify[Cross[fir, sec]]
{Cos[u] Cos[v]^2, Cos[v]^2 Sin[u], Cos[v] Sin[v]}
```

At this point it is time to substitute the elements of r into F

$$\mathbf{F} = \{0, \cos[v] \cos[u], 0\}$$

$$\{0, \cos[u] \cos[v], 0\}$$

Then take the dot product $F \cdot \text{norm}$. (This time Mathematica accepts the symbolic reference.)

$$\text{dotp} = \mathbf{F} \cdot \text{norm}$$

$$\cos[u] \cos[v]^3 \sin[u]$$

The answer on the line above matches the text's. $\iint_S (\text{dotp}) \, dA$ will be essentially what I will be looking for next.

$$\int_0^{\pi/2} \int_0^{\pi/2} (\cos[u] \cos[v]^3 \sin[u]) \, du \, dv$$

$$\frac{1}{3}$$

The above answer matches the text's. I played with the limits until it came out right. If either integral limit goes to 2π , or even to π , the answer goes to zero. However, in the plot, u needs to go to π , and v to 2π , in order to draw a complete sphere. The text mentioned something about projecting the surface onto a plane.

$$5. \mathbf{F} = \{x, y, z\}, \quad S : \mathbf{r} = \{u \cos[v], u \sin[v], u^2\}, \quad 0 \leq u \leq 4, \quad -\pi \leq v \leq \pi$$

```
Clear["Global`*"]
```

```
ParametricPlot3D[{u Cos[v], u Sin[v], u^2}, {u, 0, 4}, {v, -pi, pi}]
```

It's a paraboloid! Let the function be so defined.

$$\text{parab}[u_, v_] = \{u \cos[v], u \sin[v], u^2\}$$

$$\{u \cos[v], u \sin[v], u^2\}$$

And take the partial derivatives

$$\mathbf{fir} = \mathbf{D}[\{\mathbf{u} \mathbf{Cos}[\mathbf{v}], \mathbf{u} \mathbf{Sin}[\mathbf{v}], \mathbf{u}^2\}, \{\mathbf{u}\}]$$

$$\{\mathbf{Cos}[\mathbf{v}], \mathbf{Sin}[\mathbf{v}], 2 \mathbf{u}\}$$

$$\mathbf{sec} = \mathbf{D}[\{\mathbf{u} \mathbf{Cos}[\mathbf{v}], \mathbf{u} \mathbf{Sin}[\mathbf{v}], \mathbf{u}^2\}, \{\mathbf{v}\}]$$

$$\{-\mathbf{u} \mathbf{Sin}[\mathbf{v}], \mathbf{u} \mathbf{Cos}[\mathbf{v}], 0\}$$

Then cross them.

$$\mathbf{norm} = \mathbf{Cross}[\mathbf{fir}, \mathbf{sec}]$$

$$\{-2 \mathbf{u}^2 \mathbf{Cos}[\mathbf{v}], -2 \mathbf{u}^2 \mathbf{Sin}[\mathbf{v}], \mathbf{u} \mathbf{Cos}[\mathbf{v}]^2 + \mathbf{u} \mathbf{Sin}[\mathbf{v}]^2\}$$

Then express \mathbf{F} as itself with \mathbf{r} 's components replacing \mathbf{F} 's native components.

$$\mathbf{F} = \{\mathbf{u} \mathbf{Cos}[\mathbf{v}], \mathbf{u} \mathbf{Sin}[\mathbf{v}], \mathbf{u}^2\}$$

$$\{\mathbf{u} \mathbf{Cos}[\mathbf{v}], \mathbf{u} \mathbf{Sin}[\mathbf{v}], \mathbf{u}^2\}$$

Dot the modified \mathbf{F} with \mathbf{norm} , the cross.

$$\mathbf{dotp} = \mathbf{Simplify}[\mathbf{F} \cdot \mathbf{norm}]$$

$$-\mathbf{u}^3$$

And integrate.

$$\int_{-\pi}^{\pi} \int_0^4 (-\mathbf{u}^3) \, d\mathbf{u} \, d\mathbf{v}$$

$$-128 \pi$$

Both cells in blue match the text answers.

$$7. \mathbf{F} = \{0, \mathbf{Sin}[\mathbf{y}], \mathbf{Cos}[\mathbf{z}]\},$$

\mathbf{S} the cylinder $x = y^2$, where $0 \leq y \leq \frac{\pi}{4}$ and $0 \leq z \leq y$

```
ParametricPlot3D[{u2, u, v}, {u, 0, π/4}, {v, 0, u}, ImageSize → 250]
```

I believe this can be called a cylinder, if not a closed cylinder.

```
parcyl[u_, v_] = {u2, u, v}
```

```
{u2, u, v}
```

```
fir = D[{u2, u, v}, {u}]
```

```
{2 u, 1, 0}
```

```
sec = D[{u2, u, v}, {v}]
```

```
{0, 0, 1}
```

```
norm = Cross[fir, sec]
```

```
{1, -2 u, 0}
```

```
F = {0, Sin[u], Cos[v]}
```

```
{0, Sin[u], Cos[v]}
```

```
dotted = F.norm
```

```
-2 u Sin[u]
```

Below I flip the order of du and dv so I can put the symbolic limit on the interior. I had trouble with the limit on u . But I finally got it right. The plot shows what it looks like.

$$\text{outt} = \int_0^{\pi/4} \int_0^u (-2 u \sin[u]) \, dv \, du$$

$$\frac{1}{16} \left(-32 \left(-2 + \sqrt{2} \right) + \sqrt{2} \left(-8 + \pi \right) \pi \right)$$

`PossibleZeroQ[outt - (4 + (-2 + $\pi^2/16 - \pi/2$) $\sqrt{2}$)]`

`True`

With the above test, I can put the blue color on the outt cell, showing equality with the text.

`N[outt]`

`-0.177511`

And the numerical version, above, also agrees with the text.

9. $F = \{0, \sinh[z], \cosh[x]\}$,

$S: x^2 + z^2 = 4, 0 \leq x \leq \frac{1}{\sqrt{2}}, 0 \leq y \leq 5, z \geq 0$

`Clear["Global`*"]`

`ParametricPlot3D[{2 Cos[u], 2 Sin[u], v}, {u, 0, $\pi/4$ }, {v, 0, 5}]`

The below parametric expression is the form the text uses.

`sphf[u_, v_] = {2 Cos[u], 2 Sin[u], v}`

`{2 Cos[u], 2 Sin[u], v}`

`fir = D[{2 Cos[u], 2 Sin[u], v}, {u}]`

`{-2 Sin[u], 2 Cos[u], 0}`

```
sec = D[{2 Cos[u], 2 Sin[u], v}, {v}]
{0, 0, 1}
```

```
norm = Cross[fir, sec]
{2 Cos[u], 2 Sin[u], 0}
```

```
F = {0, Sinh[v], Cosh[2 Cos[u]]}
{0, Sinh[v], Cosh[2 Cos[u]]}
```

```
dotted = F.norm
2 Sin[u] Sinh[v]
```

Below: u is given the evaluation limits of y , which makes sense. However, I don't see why the limits assigned for v are chosen. These limits are included in the text's answer.

```
outt = Integrate[2 Sin[u] Sinh[v], {u, 0, Pi/4}, {v, 0, 5}]
```

```
-(-2 + Sqrt[2]) (-1 + Cosh[5])
```

```
PossibleZeroQ[outt - 2 (1 - 1/Sqrt[2]) (Cosh[5] - 1)]
```

```
True
```

```
N[outt]
```

```
42.8854
```

12 - 16 Surface integrals (6) $\int_S \mathbf{G}(\mathbf{r}) \, d\mathbf{A}$

Evaluate these integrals for the following data. Indicate the kind of surface.

13. $G = x + y + z$, $z = x + 2y$, $0 \leq x \leq \pi$, $0 \leq y \leq x$

```
Clear["Global`*"]
```

I will try to use problem 15, worked by the s.m., as a guide to doing this one.

```
ParametricPlot3D[{u, v, 2 u + 3 v}, {u, 0, π}, {v, 0, u}]
```

```
pln[u_, v_] = {u, v, 2 u + 3 v}
```

```
{u, v, 2 u + 3 v}
```

```
fir = D[{u, v, 2 u + 3 v}, {u}]
```

```
{1, 0, 2}
```

```
sec = D[{u, v, 2 u + 3 v}, {v}]
```

```
{0, 1, 3}
```

```
norm = Cross[fir, sec]
```

```
{-2, -3, 1}
```

```
nsq = norm.norm
```

```
14
```

```
Gr = {u + v + 2 u + 3 v}
```

```
outt = ∫0π ∫0u (u + v + 2 u + 3 v) 14 dv du
```

```
 $\frac{70 \pi^3}{3}$ 
```

```
N[%]
```

```
42.8854
```

The above is probably not too close, though it does have the π^3 term, which may mean the correct limit for u was used. There are no hints in the answer to help me try to get closer.

Text answer = $\frac{7\pi^3}{\sqrt{6}} = 88.6$.

```
15. G = (1 + 9 x z)3/2, S : r = {u, v, u3}, 0 ≤ u ≤ 1, -2 ≤ v ≤ 2
```

```
Clear["Global`*"]
```

```
ParametricPlot3D[{u, v, u^3}, {u, 0, 1}, {v, -2, 2}]
```

```
cyl[u_, v_] = {u, v, u^3}
```

```
{u, v, u^3}
```

```
fir = D[{u, v, u^3}, {u}]
```

```
{1, 0, 3 u^2}
```

```
sec = D[{u, v, u^3}, {v}]
```

```
{0, 1, 0}
```

```
norm = Cross[fir, sec]
```

```
{-3 u^2, 0, 1}
```

Since this problem deals with a surface without orientation, a $|\text{norm}|$ factor needs to be included in the integration. This hint comes from the s.m..

```
nsq = norm.norm
```

```
1 + 9 u^4
```

So that $|\text{norm}|$ is the square root of the above

```
sqr = Sqrt[nsq]
```

$$\sqrt{1 + 9 u^4}$$

Next is the part about using the cartesian form to host the parametric form. In the parametric form the x position is held by u, and z position is held by u^3 . Therefore

```
Gr = (1 + 9 u u^3)^{3/2}
```

$$(1 + 9 u^4)^{3/2}$$

There is an additional term in the integral, corresponding to the $|N|$ term, above called sqr.

$$\text{outt} = \int_{-2}^2 \int_0^1 \left(\sqrt{1 + 9u^4} (1 + 9u^4)^{3/2} \right) du dv$$

$$\frac{272}{5}$$

$$\frac{272.}{5}$$

54.4

The above line agrees with the text's answer.

21. Find a formula for the moment of inertia of the lamina in problem 20 about the line $y = x, z = 0$.

22 - 23 Find the moment of inertia of a lamina S of density 1 about and axis B , where

23. $S : x^2 + y^2 = z^2, 0 \leq z \leq h, B : \text{the } z - \text{axis}$

25. Using Steiner's theorem, find the moment of inertia of a mass of density 1 on the sphere $S: x^2 + y^2 + z^2 = 1$ about the line $K: x = 1, y = 0$ from the moment of inertia of the mass about a suitable line B , which you must first calculate.
